VERSA 06 PLUS

FTIR ANALYSIS SYSTEM

The IAG nG versa06 plus combines in a single system the wide range of options offered by FTIR technology with the reliability of standard measurement technology. Our aim is to provide the ideal solution for any application and to allow every user to make use of tried and trusted measurement technology. We therefore support the option of integrating all analyzers available on the market and of combining these to achieve a complete customized system. The outstanding features of the IAG nG versa06 plus include ease of use, large dynamic measurement range, precise gas feed, maintenance friendliness, and the flexibility offered by the IAG nG module system.

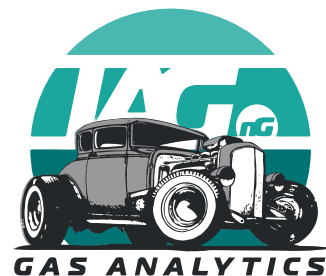

IAG-nG inlet valve

VFS /PRE-FILTER SYSTEM

The IAG-nG VERSA06 can be combined with any IAG-nG sampling modules. The options here extend from a simple heated line delivering the sample, to extensive multiple extraction systems with high pressure regulators, switching units and high temperature sample lines. All sampling modules are remotely controlled by the measurement device itself and are displayed in the device software. Every parameter such as temperature and switching status for the entire system can be configured and operated from a central location.
